

TraumaHQ powered by IQVIA™ is a revolutionary suite of trauma software products developed by IQVIA and customized by the Pennsylvania Trauma Systems Foundation for use by trauma centers, healthcare systems, and state government. Key features include:

- Registry/PIPS collaborative experiences where both components of the trauma program can simultaneously work together in the same records.
- Dashboard visualizations reflecting the current state of Registry and PIPS programs. Metrics include both demographics and productivity. Functionality allows access to records with a click of a hyperlink (drillable).
- PIPS software which supports work on a group of records with the same tracked event/OFI. Issues can be documented just once and linked to multiple records.
- Meeting manager technology which pushes documentation of meeting minutes out to multiple records.
- Report module which is customizable by end-users and powered by Spotfire.
- Application for Survey (AFS) module designed to automatically retrieve Registry and Performance Improvement data.
- Central site module which generates reporting and viewing of aggregate data for all records of one or more hospital sites.
- Inter-rater reliability module which allows hospitals to assure accuracy of data collection between users of the Trauma Registry and Performance Improvement modules.
